

Graphical User Interface and Command Line Interface are both essential ways of viewing and manipulating information online. When using something like Graphical User Interface (GUI), it is more of a visual way of interacting with a computer, so think of a menu screen, anything with icons, utilizing windows, etc. When you have something like Command Line Interface (CLI), it is more so a form of understanding and changing data. So think creating/deleting files, running programs, and navigating code lines. One thing to mention is that CLI is known to be much faster than GUI, and gives for quicker manipulation.
